

KAMUI

Safe Treasury Preflight

A local stress check for Safe Transaction Builder batches

The buffer question

A Safe batch can contain clear transfers alongside arbitrary calls.

The reviewer needs to know the first call that exceeds a stated balance under each fee and outflow assumption.

Unclassified calldata stops the reviewable prefix. Safe's own simulation still matters before signing.

A working local prototype

Funded prefix in a four-call synthetic batch

4 calls total

Call 4 stays unclassified

No wallet connection or
transaction submission

Numbers use invented balances and addresses.

Evidence and next work

Built now

Local browser interface and Python analyzer
16 passing unit tests
Read-only checks against a public Sepolia Safe

Next

Validate current Safe exports, gas modes, and comparisons with Safe simulation on public examples.

No users, deployed integration, or execution-safety claim yet.
